## MARKET COMMENTARY

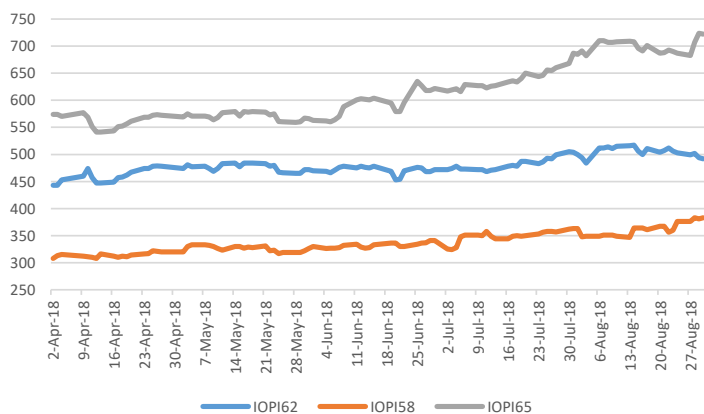

Iron ore markets were relatively stable today even as rebar futures trended lower. According to SMM, Chinese rebar inventories declined this week, putting pressure on prices. Despite production cuts announced in Tangshan, mills continue to purchase material. Some traders in east China remain relatively confident in iron ore prices in Shandong while prices in Tangshan may encounter a price ceiling. This could narrow the price spread between the two regions.

Fe %	65.00	62.00	58.00	MMI iron ore port stock indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMI by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data. IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
