MARKET COMMENTARY

Traders had less room to manoeuvre today, with the DCE futures market rising and steel mills keeping current purchasing levels low. According to SMM, mills profits for rebar have fallen to 327yuan/mt and that for HRC to 211yuan/mt. This represents the margins reducing by 943yuan/mt and 1187yuan/mt from this years high points. As a result, mills preference for low grade iron ore products is rising. It is predicted that the shrinking price spread between high and low grade iron ore products may continue given the narrow profit margins and damping demand from downstream sectors.

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
