Today, iron ore futures continued last week's downward trend. The most-traded I2505 contract closed at 779.5 yuan/mt, down 2.81% for the day. Traders showed moderate willingness to sell, while steel mills purchased as needed, mainly adopting a high-frequency, low-volume procurement strategy. The mainstream transaction prices of PB fines in Shandong were 780-790 yuan/mt, down 10-15 yuan/mt from last Friday, while in Tangshan, the transaction prices were around 795-800 yuan/mt, also down 10-15 yuan/mt from last Friday.

According to SMM shipping data, iron ore shipments from Australia and Brazil last week rebounded significantly to a yearly high, with global shipments up 37.7% WoW. Despite a decline of 11% in port arrivals, the overall supply remains ample in the near term. Ahead of the Two Sessions, coupled with severe smog expected in north China, Tangshan took the lead in issuing production restriction notices, with some steel mills conducting blast furnace maintenance, which may further reduce pig iron production. Under the dual pressure of increasing supply and

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
