MARKET COMMENTARY

The most-traded iron ore futures contract continued to trade in the doldrums today, with the most-traded I2601 contract closing at 776.5, down 1.46% from the previous day. Traders showed moderate willingness to sell; steel mills purchased as needed, with some restocking at low levels, and inquiries were moderate. Market transaction sentiment remained moderate. In Shandong, mainstream transaction prices for new PB fines were around 768-772 yuan/mt, down 2-5 yuan/mt from the previous day; in Tangshan, transaction prices for new PB fines were 780-785 yuan/mt, down 3-5 yuan/mt from the previous day. According to an SMM survey, as of October 15, the blast furnace operating rate among 242 steel mills tracked by SMM stood at 87.14%, down 0.15 percentage point MoM. Daily average hot metal production at the sampled steel mills was 2.4172 million mt, down 4,100 mt MoM. Considering the current contraction in steel mill profits and stricter environmental protection inspections in some regions, hot metal production is expected to drop back slightly next week. In the short term, iron ore demand is likely to decline further, weighing on ore prices. Short-term market sentiment remains weak, but with an important meeting expected to be held in late October, market expectations are heating up, boosting sentiment and raising the possibility of a rebound in iron ore prices.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
