MARKET COMMENTARY

DCE iron ore futures fall by 1.38 in the today. the main contract I2405 closed 1000. Some traders adopt separate quotations. Some steel mills tended to be wait-and-see, and purchased on demand. total transactions remained insipid. PBF at Shandong port dealt 1045-1050 yuan/mt; decreased 10-15 yuan/mt over yesterday. SSF at Tangshan port dealt 940 yuan/mt; decreased 5 yuan/mt over yesterday. As of January 5th, SMM has tracked a total of 119.31 million tons of inventory in 35 ports, with a cumulative inventory of 2.41 million tons compared to last week; The daily average port clearance volume of imported ore in this period increased by 78000 tons on a weekly basis to 2.937 million tons. This week, port clearance continued to increase, but the growth rate slowed down. This is mainly due to the demand for restocking in steel mills near the Spring Festival. However, the current iron ore price is relatively high, and the pace of restocking is slow. Looking ahead next week, pre holiday restocking may drive an increase in transaction volume, while mining prices still have support and are expected to fluctuate at high levels.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

For more details on MMi's iron ore methodology please download the guide published on our website at: www.mmiprices.com

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
