IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Sep 19th, 2024		CFR Qingdao, USD/dry tonne							Today, iron ore rebounded from its bottom and fluctuated upward throughout the day. The most-traded contract (2501) finally closed at 693 yuan/mt, with a daily increase of 1.69%. Speculative trading among traders increased, steel mills mainly remained on the sidelines, with some planning tenders. Today's market transaction atmosphere was average. The transaction price of PB fines in Shandong was around 675-695 yuan/mt, up 0-20 yuan/mt from yesterday, in Tangshan, the transaction price of PB fines was around 695-715 yuan/mt, up 0-15 yuan/mt from yesterday. In the early morning, the FOMC meeting announced that the US Fed would cut interest rates by 50 basis points, slightly exceeding market expectations. During the period from the announcement to Powell's speech, the overseas market generally reacted with a "buy the rumor, sell the news" sentiment, causing iron ore futures to slightly retreat after opening. However, in the short term, the rate cut is beneficial to the real estate and manufacturing sectors. This also led to increased market expectations for macroeconomic policies in the fourth quarter, driving the futures market to rise rapidly. Driven by macro factors and pre-holiday restocking, it is expected that iron ore prices will continue to fluctuate upward in the short term.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
