MARKET COMMENTARY

Today, the DCE iron ore market trended weaker. The benchmark contract, I2605, closed at 761.5 RMB/tonne, down 0.46% from the previous trading session. Spot prices in the physical market fell by 1–3 RMB/tonne compared to the prior day. Traders displayed average enthusiasm for quoting, mostly following market trends, while steel mills made few inquiries and largely maintained a wait-and-see stance. Consequently, the overall trading atmosphere was relatively subdued.

Regarding fundamental data, SMM statistics for last week show total global iron ore shipments at 34.8 million tonnes, a week-on-week increase of 13.3%. Shipments from both mainstream origins (Australia, Brazil) and non-mainstream origins (such as India) recorded growth. Meanwhile, SMM statistics indicate that arrivals at Chinese ports stood at 27.63 million tonnes, a week-on-week decline of 5.9%.

Looking ahead, although the recent rise in port discharge rates combined with the decline in arrivals has provided phased relief to supply-side pressure, overall visible port inventories remain at high levels. There is no clear inflection point for destocking as yet, and the suppressive effect of high inventory persists. On the demand side, as the Spring Festival approaches, steel mill restocking has essentially concluded, and the pace of raw material procurement has slowed, significantly weakening the support for iron ore prices. Furthermore, the macro and news landscape is currently in a relative vacuum, leaving the market devoid of substantive bullish drivers. Therefore, in the short term, iron ore prices are expected to struggle to shake off this weak pattern, likely continuing a trend of low-level volatility.

Iron Ore Index Compilation Rationale and Data Exclusions

MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.

Data Exclusions*

	62%	58%	65%
Port Index	0	0	0
Seaborne index	0		0
Lump Index 62.5	0		

* Number of price submissions for iron ore indices that were excluded from index calculations today as they were anomalous and could not be verified

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
