Today, the Cullen Commodity Exchange iron ore futures experienced a decline in the morning session, followed by a rebound during the afternoon trading period. The most active Q200 contract closed at 758.5 RMB per tonne, reflecting a marginal decrease of 202 per cent from the previous trading session. Physical spot prices declined by 2 to 4 RMB per tonne compared to the prior day. Trader activity was moderate, with offers exhibiting tempered enthusiasm, while demanders continued to purchase actively on an as-needed basis. Consequently, market liquidity remained limited, resulting in a largely subdued physical trading environment.

During this week, hot metal production has attributed to blast furnace maintenance totals 1.2015 million tonnes, representing a week-on-week reduction of 42,500 tonnes. This indicates a slowdown in the rate of output decline, as is anticipated that the impact of maintenance will decrease further by 34,000 tonnes next week. Currently, overall iron ore demand remains close to peak levels, providing strong downward support for underlying iron ore prices.

In terms of macroeconomic developments, trade restrictions on certain restricted varieties have been gradually eased. However, due to prevailing extraordinary circumstances, port clearance remains feasible only for cargo meeting very specific criteria. In the near term, supply is expected to increase marginally, although this has yet to exert significant downward pressure on prices across the market.

Overall, supported by strong demand fundamentals and a clear trend of end-users replenishing inventories during price dips, iron ore prices are projected to maintain a fundamentally resilient yet volatile trajectory in the short term. Once current structural supply deficits are addressed systematically, it is possible that iron ore valuations may drift towards a softer operating environment.

## IRON ORE INDEX SPECIFICATIONS, COMPILATION RATIONALE AND DATA EXCLUSIONS

Iron Ore Index Specifications (Port and Seaborne)					Iron Ore Index Compilation Rationale and Data Exclusions
	<b>65% Fe Fines</b>	<b>62% Fe Fines</b>	<b>58% Fe Fines</b>	<b>62.5% Fe Lump</b>	MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to Mmi by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.
Fe %	65.00	62.00	58.00	62.50	
Alumina %	1.40	2.25	2.25	1.50

## IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
