IRON ORE SEABORNE INDEX (IOSI)

MARKET COMMENTARY

Apr 1st, 2026		CFR Qingdao, USD/dry tonne							The iron ore market showed a volatile pattern today, with prices fluctuating upward in the morning before retreating in the afternoon. The main contract (IOPI62) closed at 812 yuan/ton, up 0.12% from the previous trading session. Spot prices rose by approximately 2 yuan/ton compared to the previous trading day. Traders showed moderate willingness to offer quotes, while steel mills primarily purchased for just-in-time replenishment, with inquiries remaining cautious. As of now, spot market transactions are relatively subdued. On the fundamental data front this week, according to SMM's monitoring of average daily hot metal output, the blast furnace operating rate increased by 1.05 percentage points week-on-week to 89.71%, while average daily hot metal output reached 2.436 million tons, up 25,700 tons from last week. The steady resumption of blast furnace operations over the past three weeks has effectively driven rigid demand for iron ore raw materials, providing solid support for iron ore prices. Overall, the iron ore fundamentals exhibit strong downward support while facing upward pressure from inventory levels. In the short term, iron ore prices are expected to fluctuate within a narrow range, with potential price movements awaiting new market information or changes.

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
