Today, the DCE Iron ore market traded with a weak, volatile bias. The benchmark contract, I2605, ultimately closed at 762.5 RMB/tonne, representing a marginal decline of 0.07% from the previous trading session. Conversely, spot prices in the physical market rose slightly by approximately 4 RMB/tonne. Traders demonstrated moderate enthusiasm for quoting, with transaction prices largely determined through negotiation on firm bids. Steel mills prioritized rigid demand restocking, maintaining a cautious approach to inquiries. Overall, the market trading atmosphere remained average.

According to the latest SMM statistics for this week, daily average hot metal output from sample blast furnaces recorded 2.386 million tonnes, an increase of 15,800 tonnes week-on-week. This growth is primarily attributed to the incremental contribution from blast furnaces resuming production following maintenance.

Looking ahead, as the intensity of blast furnace maintenance weakens on the margin, daily average hot metal output is projected to maintain a steady upward trajectory. This will provide sustained rigid support for iron ore demand, signalling a substantive improvement in the demand-side fundamentals.

However, the market remains suppressed by a "dual high" inventory structure—comprising elevated in-plant stocks at steel mills and visible inventories at ports. These ample inventory levels act as an effective buffer against the release of raw material procurement demand, creating a distinct lag in the transmission of incremental rigid demand to the price mechanism. On balance, amidst the interplay of recovering rigid demand and persistent inventory pressure, iron ore prices are expected to exhibit a pattern of low-level volatility with a firm bias in the short term. The overall price centre is likely to shift marginally upwards.

IRON ORE INDEX SPECIFICATIONS, COMPILATION RATIONALE AND DATA EXCLUSIONS

Iron Ore Index Specifications (Port and Seaborne)					Iron Ore Index Compilation Rationale and Data Exclusions
	65% Fe Fines	62% Fe Fines	58% Fe Fines	62.5% Fe Lump	MMi iron ore indices are compiled from data provided by companies that are part of the iron ore supply chain and involved in spot market transactions. The indices are calculated using detailed transaction-level data submitted to MMI by these companies. This data is normalised to the appropriate specifications and screened to remove outliers before volume-weighted average prices are calculated from the remaining core set of data.
Fe %	65.00	62.00	58.00	62.50	
Alumina %	1.40	2.25	2.25	1.50

IRON ORE DOMESTIC CONCENTRATE INDEX CALCULATION METHODOLOGY

The compilation method for price index generally refers to the compilation method of CPI price index and other price indices, breakdown the price data and calculate the average value according to a certain method, taking the vertical axis as the regional composite index (average of different grade index) and the horizontal axis as the grade composite index (average of different regional index), a total composite index for domestic ore can be output ultimately. The process system is also adopted in the calculation i.e. each sub-index can be obtained as well.
